

<p><i>Deliberate and specific retrieval of expected prior knowledge (be specific)</i></p> <p>Atoms and Elements: Atoms are the basic units of matter; each element consists of atoms with a specific number of protons.</p> <p>Subatomic Particles: Atoms are composed of protons, neutrons, and electrons.</p> <p>Atomic Number and Mass Number: The atomic number represents the number of protons, and the mass number is the total number of protons and neutrons.</p> <p>Isotopes: Atoms of the same element with different numbers of neutrons.</p> <p>Ions: Atoms that have gained or lost electrons, resulting in a charged particle.</p>	<p><i>Academic transformation (be specific)</i></p> <p>Understand when radioactive decay and the different forms of radiation</p> <p>Describe the different types of radiation and how far they traveling in air, what they can be stopped by and their ability to ionize</p> <p>Complete decay equations for alpha and beta</p> <p>Define the term half life</p> <p>Calculate half lives</p> <p>Explain the difference between contamination and irradiation</p> <p>Describe precautions needed when handling radioactive isotopes</p> <p>Evaluate the uses of radiation</p> <p>Triple only: describe the process of nuclear fission and fusion</p>	<p><i>Personal transformation (2 or 3)</i></p> <p>Historical Development: The discovery of radioactivity by Henri Becquerel and the subsequent research by Marie and Pierre Curie.</p> <p>Real-World Applications: The use of radiation in medicine (e.g., cancer treatment), industry (e.g., sterilisation of equipment), and energy production (e.g., nuclear power).</p> <p>Ethical Considerations: Debating the ethical implications of using radioactive materials, especially in medicine and energy production.</p>
<p><i>Can I Learning Questions</i></p> <p><i>Can I recall the properties of alpha, beta and gamma radiation?</i></p> <p><i>Can I complete decay equations for alpha and beta?</i></p> <p><i>Can I define and calculate half lives?</i></p> <p><i>Can I describe how each type of radiation can be considered dangerous?</i></p> <p><i>Can I evaluate the uses of radiation?</i></p> <p><i>Can I describe nuclear fission?</i></p>	<p><i>Literacy and Oracy</i></p> <p>Group Discussions: Debate the pros and cons of nuclear energy and the use of radiation in medical treatments.</p> <p>Presentations: Create presentations on the history of radioactivity or the applications of radiation in various fields. (HWK)</p> <p>Reports: Write reports on the safety measures required when handling radioactive materials.</p> <p>Interactive Resources: BBC Bitesize: Nuclear Radiation Save My Exams: Types of Radiation</p>	<p><i>Misconceptions (5 or 6 examples)</i></p> <p>Misconception: Gamma radiation is the most dangerous because it is the most penetrating. Clarification: While gamma radiation is highly penetrating, it is less ionising than alpha and beta radiation. The danger depends on the type of radiation and the exposure context.</p> <p>Misconception: Alpha particles are the most dangerous type of radiation. Clarification: Alpha particles are highly ionising but have low penetrating power, making them dangerous only if ingested or inhaled.</p> <p>Misconception: All radiation is harmful. Clarification: Low levels of radiation, such as</p>
